

I see https and the company ID. I can trust this website!

# Domain Validation or Extended Validation

Shall I buy on this site, or somewhere else?

# Domain Validation or Extended Validation

**tbs internet**  
trust booster

Founded in France in 1996, TBS Internet launched the SSL certificate aggregator business in order to best serve customers. 15 years later, we are providing certification solutions and offering the largest product range on the market, embracing technology and audit changes.

Buy directly these SSL brands from our website and receive extra advice at no extra cost.

## Explanation

Many SSL certificates are available on the market and it can be confusing. In a nutshell, some provide full authentication and encryption while the others only activate https connections without displaying Company IDs. They are called Domain-Validated (DV).

Cheaper and issued within minutes, they might seem appealing but can't be trusted when it comes to protect personal data: the transmission path could be leaded to any recipients such as fraudsters.

### How to recognise a Domain-validated certificate?

Click on the padlock: seeing the name of the organization indicates a good security level, if not you are facing a DV certificate which anonymize the website owner.

HTTPS + Company ID = TRUST | HTTPS + No Company ID = NO TRUST

## Solution

The Extended Validation certificate is an all-in-one solution and the most secure product currently available on the market.

- EV certificates are spotted AT A GLANCE thanks to their unique green visual indicator (such as the green address bar). This indicator cannot be copied by fraudsters.
- EV certificates display the website's owner name directly on the user interface (no need to trigger the padlock to find out). It creates trust and TRUST MEANS BUSINESS!
- Thanks to EV's worldwide quality vetting process, consumers get a clear reassurance on whom they are dealing with.

Did you know that encryption (https) connections grew up along with the Internet? Certification Authorities (SSL issuers) and Internet browser vendors have always been working together to create trusted connections.
